

HIMACHAL PRADESH UNIVERSITY

Courses of Study and Syllabi for M. Sc. Physics (Effective from the session 2009 onwards)

<u>Semester-I</u>	Max. Marks
Course-PHYMS-I01 Mathematical Physics	80+ 20 I.A.
Course- PHYMS-I02 Classical Mechanics	80+ 20 I.A.
Course- PHYMS-I03 Electronics- I	80+ 20 I.A..
Course- PHYMS-I04 Computational Methods in Physics	80+ 20 I.A..
Course- PHYMS-I05 Laboratory	80+ 20 I.A..
Additional Optional Course I-PHYMS-I06 Computer Application in Physics Nodal Center based	80+ 20 I.A..
<u>Semester-II</u>	
Course- PHYMS-201 Quantum Mechanics-1	80+ 20 I.A.
Course- PHYMS-202 Condensed Matter Physics	80+ 20 I.A..
Course- PHYMS-203 Statistical Physics	80+ 20 I.A..
Course- PHYMS-204 Electrodynamics	80+ 20 I.A..
Course- PHYMS-205 Laboratory	80+ 20 I.A..
Additional Optional Course-II - PHYMS-206 Computer Application in Physics Nodal Center based	80+ 20 I.A..
<u>Semester-III</u>	
Course- PHYMS-301 Quantum Mechanics-II	80+ 20 I.A..
Course- PHYMS-302 Material Science	80+ 20 I.A..
Course- PHYMS-303 Nuclear Physics	80+ 20 I.A..
Course- PHYMS-304 High Energy Physics	80+ 20 I.A..

80+ 20 I.A.

Semester-IV

Course- PHYMS-401 Electronics óII 80+ 20 I.A.

Course- PHYMS-402 Elective Papers one of the following 80+ 20 I.A.

- i) PHYMS-402 (a) Advanced High Energy Physics 80+ 20 I.A..
- ii) PHYMS-402 (b) Nuclear & Particle Astrophysics 80+ 20 I.A..
- iii) PHYMS-402 (c) Advanced Quantum Mechanics 80+ 20 I.A.

Course- PHYMS-403 Elective Papers one of the following 80+ 20 I.A..

- i) PHYMS-403 (a) Nano Physics 80+ 20 I.A..
- ii) PHYMS-403 (b) Mesoscopic Physics 80+ 20 I.A..
- iii) PHYMS-403 (c) Advanced Computational Physics 80+ 20 I.A..

Course- PHYMS-404 Elective Papers one of the following 80+ 20 I.A.

- i) PHYMS-404 (a) Advanced Nuclear Physics 80+ 20 I.A.
- ii) PHYMS-404 (b) Nuclear Technology 80+ 20 I.A.
- iii) PHYMS-404 (c) Opto ó Electronics 80+ 20 I.A..

Course- PHYMS-405 **Project** 100

SEMESTER - I

Course Code	PHYMS-101		No. of hour per semester	52
Name of the course	Mathematical Physics			
Duration of the Course	One Semester (13 Weeks)			
Lectures to be Delivered	39 (13 X 3)			
Tutorial	13 (13 X 1)			
Semester End Examination	Total Maximum Marks = 100		Pass Marks	
	Theory	MM 80	32	
	Internal Assessment	MM 15	06	
	Attendance	MM 5	----	

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section A

Complex Variables:

Analyticity of the function of a complex variable, Cauchy integral theorem and formula. Expansion of an analytic function; Taylor and Laurent series. Residue theorem, contour integration, Jordan Lemma. Applications in evaluation of definite integrals. Dispersion relation, saddle point method.

Vector Spaces:

Vector Spaces and Matrices; linear independence, Bases; dimensionality; inner product; linear transformations. Matrices; Inverse; Orthogonal and Unitary matrices; Independent elements of a matrix; Eigen-values and eigen-vectors; Diagonalization; Complete orthonormal set of functions.

Section B

Special and Orthogonal Functions:

Partial differential equations, separation of variable technique in Cartesian, Spherical, Cylindrical Coordinates. Special functions related to these equations (Laguerre, Bessel's, Legendre and Hermite) and their applications to boundary value problems, Sturm-Liouville theory and orthonormal eigen-functions. Beta and Gamma functions. Fourier

r properties. Applications of Laplace Transforms to solve

Section C

Green's Function:

Non homogeneous boundary value problems and Green's functions in one dimension. Eigen-function expansion of Green's function. Fourier transform method of constructing the Green's function, Green's function in 3-dimensions, application to scattering problem

Group Theory:

Postulates, multiplication tables, subgroup, direct product group, isomorphism and homomorphism. Representation of a group, Schur's Lemma and orthogonality theorem (Statement only), reducible and irreducible representation. Permutation group C_{4v} group (group of the symmetry of a square), Lie group, Lie algebra, orthogonal groups and unitary group.

Books Recommended:

1. G. Arfken: Mathematical Methods for Physicist 4th edition (Academic Press).
2. J. Mathews and R. L. Walker: Mathematical Methods of Physics (I. B. House Pvt.Ltd.).
3. C. Harper: Introduction to Mathematical Physics (Prentice Hall of India).
4. A. W. Joshi: Vectors & Tensors (Wiley Eastern Limited).
5. A. W. Joshi: Elements of Group Theory (Wiley Eastern).
6. Riley, Hobson & Bence: Mathematical Methods for Physics and Engineering (Cambridge University Press)

NOTE: - In all, 10 questions will be set. Question No.1 will cover the entire syllabus and will be of objective short answer type. The remaining 9 questions will be set taking three questions each from Sections A, B and C. The student will attempt 5 questions in all, including question No. 1 (compulsory) and selecting at least one question from each section A, B and C.

	PHYMS-102	No. of hour per semester	52
Name of the course	Classical Mechanics		
Duration of the Course	One Semester (13 Weeks)		
Lectures to be Delivered	39 (13 X 3)		
Tutorial	13 (13 X 1)		
Semester End Examination	Total Maximum Marks = 100		Pass Marks
	Theory	MM 80	32
	Internal Assessment	MM 15	06
	Attendance	MM 5	---

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section A

Variational Principles and Lagrangian Formulation of Mechanics:

D'Alembert's Principle and Lagrange's equations. Constraints and generalized coordinates. Calculus of variations, Hamilton's principle and derivation of Lagrange's equation from it. Extension to non-holonomic and non-conservative systems. Symmetry properties of space and time and the corresponding theorems (with reference to cyclic coordinates). Simple applications of Lagrangian formulation for a single particle and a systems of particles. Lagrangian formulation of relativistic mechanics.

Central Force Problem:

Equations of motion and first integrals. Equivalent one dimensional problem and classification of orbits. The virial theorem. Differential equation for a orbit with a general power law potential. **Applications:** Kepler problem; scattering in c.m. and lab-coordinates.

Section B

Kinematics and Dynamics of Rigid Bodies:

Generalized coordinates of a rigid body, orthogonal transformations and the transformation matrix. The Euler's angles and Euler's theorem on motion of rigid bodies, infinitesimal rotations, motion in a rotating frame of reference, Coriolis force on (i) air flow on the surface of earth (ii) projectile motion (iii)atomic nuclei. Angular momentum

about a point. Moment of inertia tensor, the principle axis of motion.

Applications: Torque free motion of a rigid body. Heavy symmetric top with one point fixed.

Hamilton-Jacobi Theory:

The Hamilton-Jacobi equation for (i) Hamilton's principle function, and (ii) Characteristics function. Separation of variables in Hamilton- Jacobi equation. Action angle variables. **Applications:** Harmonic oscillator with Hamilton-Jacobi and action angle variable methods. Kepler's problem with action angle variable method. The transition from discrete to continuous system.

Section C

Hamiltonian Formulation of Mechanics:

Legendre's transformations and Hamilton's equations of motion. Derivation of Hamilton's equations from variational principle. The principle of least action. Canonical transformations; Poisson's and Lagrangian brackets, their invariance under a canonical transformation, equations of motion in the Poisson's bracket notation; infinitesimal canonical transformations, constants of motion and symmetry properties.

Applications: Hamiltonian formulation of (i) harmonic oscillator and (ii) relativistic mechanics. Examples of canonical transformations, with reference to harmonic oscillator. Example of Poisson bracket, (i) harmonic oscillator; (ii) angular momentum.

Lagrangian and Hamiltonian Formulations for continuous systems and fields: Transition from discrete to continuous system, Lagrangian formulation for continuous systems stress- energy tensor and conservation theorems. Hamiltonian formulation others theorems.

Books Recommended

1. H. Goldstein, Classical Mechanics 2nd ed. (Indian Student Edition, Addison-Wesley/ Narosa).
2. J. B. Marion, Classical Mechanics (Academic Press).
3. L. D. Landau and E. M. Lifshitz, Mechanics 3rd ed. (Pergamon).
4. R. G. Takwale & P. S. Puranik, Introduction to Classical Mechanics (Tata McGraw ó Hill)
5. Kiran C. Gupta, Classical Mechanics of Particles and Rigid Bodies (Wiley Eastern).
6. N. C. Rana and P. S. Joag, Classical mechanics (TMH).

NOTE: - In all, 10 questions will be set. Question No.1 will cover the entire syllabus and will be of objective/ short answer type. The remaining 9 questions will be set taking three questions each from Sections A, B and C. The student will attempt 5 questions in all, including question No. 1 (compulsory) and selecting at least one question from each section A, B and C

	PHYMS-103	No. of hour per semester	52
Name of the course	Electronics –I		
Duration of the Course	One Semester (13 Weeks)		
Lectures to be Delivered	39 (13 X 3)		
Tutorial	13 (13 X 1)		
Semester End Examination	Total Maximum Marks = 100		Pass Marks
	Theory	MM 80	32
	Internal Assessment	MM 15	06
	Attendance	MM 5	---

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section A:

Sequential Logic: Flip-Flop: A1-Bit memory-The RS Flip-Flop, JK- Flip-Flop, JK-master slave-Flip-Flop, T Flip-Flop, D- Flip-Flop-Shift Registers, Synchronous and Asynchronous Counter, Cascade Counters, A/D and D/A Converters.

Microprocessors: Introduction to microcomputers ó input/output- interfacing devices 8085 CPU ó Architecture- BUS timings- Demultiplexing the address bus generating control signals- Instruction Set ó Addressing Modes- Illustrative Programmes ó Writing Assembly Language Programmes, Looping, Counting and Indexing ó Counters and Timing Delays- Stack and Subroutine.

Section B:

Operational amplifiers: Differential amplifiers-circuit configuration-Dual Input, Balanced Output, Differential Amplifier-DC analysis-AC analysis, Inverting and Non-Inverting Inputs, CMRR-constant current bias level translator. Block diagram of typical Op-amp-analysis, Open loop configuration, Inverting and Non-Inverting Amplifiers, Op-Amp with negative feedback-voltage series feedback óeffect of feedback on closed loop gain, Input Resistance, Output Resistance Bandwidth and Output Offset Voltage, Voltage Follower, Practical Op-Amp Input Offset voltage-Input Bias Current-Input Offset current, Total Output Offset Voltage, CMRR frequency response, DC and AC Amplifiers, Summing, Scaling and Averaging Amplifiers, Instrumentation Amplifiers, Integrator and Differentiator.

Microwave Devices: Klystron amplifiers, Velocity Modulation, Basic principle of two Cavity Klystron, Reflex klystron, Traveling Wave Tubes (TWT) , Transferred Electron Devices (Gunn Diode) , Tunnel Diode, IMPATT Diode, TRAPATT Diode.

Microwave Communications: Advantages and Disadvantages of Microwave Transmission, Loss in free space, Propagation of microwaves, Atmospheric effects on propagation, Fresnel zone problem, Ground reflection, Fading sources, Detectors, Components, Antennas used in MW Communication Systems.

Books Recommended

1. Microwaves by K.L. Gupta, Wiley Eastern Ltd. New Delhi, 1983.
2. Digital Principle and Application by, A. P. Malvino and Donald P. Leach, TMH, New Delhi 1993.
3. Electronic communication system by G. Kennedy and B. Davis, TMH, New Delhi 1993.
4. Semiconductor Devices by S. M. Sze JWS,1995
5. Op-amp and Linear Integrated Circuit by Ramakanth A. Gayakwad, PHI, second edition, 1991.
6. Microprocessor Architecture, programming and Applications with 8085/8086 by Ramesh S. Gaonkar, Wiley Eastern Ltd. 1987 (for unit v)

NOTE:- In all, ten questions will be set. Question No.1 will cover the entire syllabus and will be short answer type. The remaining 9 questions will be three each from section A, B and C. Students will attempt 5 questions in all including Q No.1 (Compulsory) and at least one from each section.

	PHYMS-104	No. of hour per semester	52
Name of the course	Computational Methods in Physics		
Duration of the Course	One Semester (13 Weeks)		
Lectures to be Delivered	39 (13 X 3)		
Tutorial	13 (13 X 1)		
Semester End Examination	Total Maximum Marks = 100		Pass Marks
	Theory	MM 80	32
	Internal Assessment	MM 15	06
	Attendance	MM 5	----

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section A

Basics: Computer arithmetic, machine precision, types of errors, subtractive cancellation, multiplicative error, errors and their estimation, flowcharting and algorithms, error propagation, errors in algorithms. Computer languages (Procedural and object oriented), Brief recapitulation of FORTRAN, C, C++, operating systems (proprietary and open source), shells, editors and programs, modular and top-down programming, Simulation and computation (examples: radioactive decay, area of a pond, value of pi)

Root Finding: Solutions of non-linear equations by plotting method, bisection method, false position method, Newton Raphson method, secant method, order of convergence in different methods. Application: developing an algorithm to find bond angle of a diatomic molecule using a modeled interaction potential.

Monte Carlo Methods: True random numbers, pseudorandom numbers, generators for pseudorandom numbers,. Tests for pseudo random number generators. Monte carlo method: Applications: Random walk, Radioactive decay simulation, area of an irregular plane, value of pi, multidimensional integration, variance reduction, importance sampling, non uniform randomness, von-neumann rejection.

Differentiation: Forward Difference, Central Difference, unstable nature of differentiation. Differentiation of interpolating polynomials.

Integration: numerical integration using trapezoidal rule, Simpson's Method, Romberg integration, Newton-Cote's formulae, Gaussian quadrature; weight function and its use in dealing with singularity in the integrand. Application: Semi-classical quantization of molecular vibrations.

Interpolation and extrapolation: Lagrange's interpolation using polynomials, difference tables, Cubic-spline method, least square method of fitting data, linear and polynomial regression. Application: Charge on Millikan's oil drop data and estimation of charge on an electron.

Simultaneous Algebraic Equations: Various matrix operations, direct and iterative methods for solving simultaneous algebraic equations, Gauss elimination method, pivoting, refinement, Gauss Seidel method

Eigenvectors and eigenvalues: homogeneous equations, characteristic equation. Method and secant method. Order of convergence in different Power method, Jacobi, Given's and Householder's methods. Applications: Electric Circuit Network problem, secular equation for dispersion relations, electronic structure of many body problems, brief overview.

Section C

Ordinary differential equations (Initial value problems): Euler, Taylor series and Second order Runge-Kutta method (derivation), Fourth order Runge-Kutta method (without derivation) Predictor-Corrector method. Numerov method, shooting method. Applications: Non-linear oscillators, schrodinger equation for particle in a box,

Partial Differential Equations (Boundary value problems): Elliptic, parabolic and hyperbolic equations and corresponding difference equations for each type. Applications: solution of Laplace's equation, Poisson Equation, and heat equation

Non-linear Dynamics: Non-linear growth, logistic map, properties of non-linear maps, fixed points, period doubling, attractors, bifurcation diagrams, generating random numbers from logistic maps, Figenbaum constant. A chaotic pendulum, limit cycle and mode coupling, phase space orbits, chaotic and random motion in phase space, bifurcation diagram of a pendulum.

Books Recommended

1. Rubin Landau, M Paez: Computational Physics (John Wiley)
2. Tao Pang: Computational Physics (Cambridge University Press)
3. V. Rajaraman: Computer Oriented Numerical Methods (PHI).
4. E Balagurusamy: Numerical Methods (Tata Mcgraw Hill).

1 Physics (Addison Wesley).

ss and Flannery: Art of Computing, Numerical Recipes

(in C, C++, Fortran) (Cambridge University Press)

NOTE:- In all, ten questions will be set. Question No.1 will cover the entire syllabus and will be short answer type. The remaining 9 questions will be three each from section A, B and C. Students will attempt 5 questions in all including Q No.1 (Compulsory) and at least one from each section

Course Code	PHYMS-105		No. of hour per semester	180
Name of the course	Laboratory			
Duration of the Course	One Semester (13 Weeks)			
Semester End Examination	Total Maximum Marks = 100		Pass Marks	
	Theory	MM 80	32	
	Internal Assessment	MM 15	06	
	Attendance	MM 5	----	

Course V: LABORATORY

Note: Students are expected to do as many experiments as possible but not less than 10 experiments out of the following list doing 3 experiments from each of the sections A, B and C. Internal assessment for the laboratory course will be based on a seminar, number of experiments performed and checked after thorough viva based on the each experiment conducted by the concerned teacher/s during the semester and attendance. Marks will be posted in the copy and on the index of the copy. A record of the same will be kept in the laboratory also.

Section A

1. Kelvin double bridge: determination of low resistance.
2. Anderson bridge: determination of self-inductance.
3. Scherring bridge: determination of capacitance.
4. Study of integrating and differentiating circuits.
5. Study of clipping and clamping circuits.
6. Study of CRO.
7. Study of characteristics of semi-conductor devices (UJT, FET).
8. Study of regulated power supply.
9. Study of thyatron characteristics.

Section B

10. e/m of electron by helical method.
11. Plank's constant by photocell.
12. Millikan's oil drop experiment.
13. Cauchy's Constant.
14. Verification of Fresnel's amplitude relations.
15. Ultrasonic wave velocity in liquids by ultrasonic diffraction.

thickness of mica sheet using Michelson Interferometer.

Section C

Computer based experiments using BASIC/ FORTRAN/C/C++:

18. Statistical and error analysis of (a) given data (b) error estimation in computation.
19. (a) Roots of a quadratic/ cubic equation (b) summation of a series.
20. Numerical differentiation and integration of simple functions.
21. Operations on a matrix (a) inversion (b) diagonalisation (3x3 matrix) (c) solution of simultaneous equations.
22. Plotting and interpolation of a function.
23. Finding the value of Pi using monte carlo method

M. Sc. PHYSICS (1st SEMESTER): LABORATORY/ PRACTICAL COURSE

1. Design of a Regulated Power Supply
2. Design of a Common Emitter Transistor Amplifier
3. Experiment on Bias Stability
4. Negative Feedback (Voltage series/shunt and current series/shunt)
5. Astable, Mono-stable and Bi-stable multivibrator.
6. Characteristics and application of Silicon Controlled Rectifier.
7. Testing goodness of fit of Poisson distribution to cosmic ray bursts by chi-square test.
8. Determination of Half Life of ^{137}Cs
9. Determination of range of Beta-rays from Ra and Cs.
10. X-ray diffraction by Telexometer.
11. Determination of Ionization potential of Lithium.
12. Determination of e/m of electron by Normal Zeeman Effect using Fabry-Perot Etalon.
13. Determination of Dissociation Energy of Iodine (I) Molecule by photographing the absorption bands of Iodine in the visible region.
 - (a) Measurement of wavelength of He-Ne Laser Light using ruler.
 - (b) Measurement of thickness of thin wire with laser.

M. Sc. Physics (1st Semester): Tutorial: Laboratory/ Practical Course

This is only a suggestive list, the faculty concerned can add more topics as per the need of the students

1. Network Analysis-Thevenin and Norton's equivalent circuits.
2. Basics of p-n junction: Diffusion current, Drift current, Junction width, forward and Reverse Biasing; Significance of Fermi level in stabilizing the junction.
3. Zener diode: Characteristics and voltage regulation.
4. Transistor biasing and stability
5. Wien's bridge and phase shift.
6. Solving Boolean expressions.

Unlimited Pages and Expanded Features](#)

Electrical pulse through absorption of nuclear radiation in

8. Dead time efficiency, counting techniques, energy resolution.
9. Lattice extinctions in X-ray diffraction.
10. Atomic scattering power and geometrical structure factor.

	PHYMS-106	No. of hour per semester	52
Name of the course	COMPUTER APPLICATIONS IN PHYSICS (Nodal Centre based course) Additional Optional Course I		
Duration of the Course	One Semester (13 Weeks)		
Lectures to be Delivered	39 (13 X 3)		
Tutorial	13 (13 X 1)		
Semester End Examination	Total Maximum Marks = 100		Pass Marks
	Theory	MM 80	32
	Internal Assessment	MM 15	06
	Attendance	MM 5	----

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section A

Essentials of operating Systems and Linux Usage:

Operating systems; DOS, Windows and Linux. Introduction to file manipulation, print, view compiling, debugging, executing, Job control, search and Miscellaneous commands in the three operating systems, Usage of text editors (edit, vi and EMACS). Problem solving; flow charts and algorithms, writing the code, testing the code. Compiling and execution

Section B

Programming language (FORTRAN 90/95):

Evolution of FORTRAN. Elements of Fortran 90 (source form, Expressions and Assignment, comments, statement ordering, intrinsic types (object classes), literal constants, implicit typing, numerical and logical declarations, character declaration, symbolic constants, scalar initialization, scalar expressions, scalar assignments, intrinsic numeric expressions, intrinsic logical operations, character operations, operation precedence), Control Constructs (if, cycle, exit, select case, indexed loops, Intrinsic and Basic I/O, Intrinsic Procedures (classes, functions, subroutines), functions (type conversion, mathematical, numeric, character, Pointers and Derived Types, Modules and Object-based Programming, Arrays (conformance, element ordering, syntax, sections, I/O, constructors, initializing)

Applications I:

Programming Exercises on Root finding, interpolation and extrapolation, least square fitting, Polynomial equation fitting, differentiation and integration, solution of ordinary differential

least ten problems).

Section C

Applications II (Software Packages):

Word processing for scientific usage. Electronic spreadsheets to model simple physical problems and graphical presentation, EXCEL, LATEX, Computer-Computer Interactions, Electronic mail, FTP, Remote Login Telnet, DOS Windows to Unix transfers.

Programming exercises (at least ten)

References

1. M. Metcalf and J. Reid, Fortran 90/95 Explained, Oxford, 1996
2. Computer oriented numerical methods, V. Rajaraman (Prentice Hall of India)
3. A Scientists and Engineers Guide to Workstations and Computers, R.H. Landau, P.J. Fink (John Wiley and Sons).
4. Red Hat Linux 7.2, Christopher Negus, IDG Books India (P) Ltd.

NOTE:- In all, 10 questions will be set. Question No.1 will cover the entire syllabus and will be of objective/ short answer type. The remaining 9 questions will be set taking three questions each from Sections A, B and C. The student will attempt 5 questions in all, including question No. 1 (compulsory) and selecting at least one question from each section A, B and C.

Computer applications: Exercises (suggested) on Additional Optional Course- I

Exercises to be done using Fortran 90/95

1. Manipulation of natural numbers (like lcm, hcf, prime
2. , sorting, conversion of decimal to binary numbers, Fibonacci sequence etc),
3. Evaluation of statistical quantities (mean, SD, correlation)
4. Summation of series
5. Matrix manipulation (add, multiply)
6. Finding root of a non-linear equation using bisection method and Newton raphson method
7. Interpolation and extrapolation Least square fitting
8. Differentiation (solution of equation of motion) Integration (area under a curve)

Exercises to be done using Excel & VBA

1. Choose a set of 10 values and find standard deviation, mean, variance, moments etc. of at least 25 data points
2. To guess the roots of a non-linear equation by conditionnal formatting
3. Simulating radioactive decay using taylor expansion
4. Plotting Special Mathematical functions using spreadsheets
5. Using spreadsheets for matrix operations such as addition, multiplication and finding the determinant
6. Create a spreadsheet to simulate projectile motion
7. solving poisson equation and laplace's equations by setting a spreadsheet.

SEMESTER II

Course Code	PHYMS-201		No. of hour per semester	52
Name of the course	Quantum Mechanics - I			
Duration of the Course	One Semester (13 Weeks)			
Lectures to be Delivered	39 (13 X 3)			
Tutorial	13 (13 X 1)			
Semester End Examination	Total Maximum Marks = 100		Pass Marks	
	Theory	MM 80	32	
	Internal Assessment	MM 15	06	
	Attendance	MM 5	---	

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section A

Matrix formulation of Quantum Mechanics:

Matrix Algebra: Matrix addition and multiplication, Nul unit and Constant Matrices, Trace, Determinant and Inverse of a Matrix, Hermitian and unitary Matrices, Transformation and diagonalization of Matrices, Function of Matrices and matrices of infinite rank. Vector representation of states, transformation of Hamiltonian with unitary matrix, representation of an operator, Hilbert space. Dirac bra and ket notation, projection operators, Schrodinger, Heisenberg and interaction pictures. Relationship between Poisson brackets and commutation relations. Matrix theory of Harmonic oscillator.

Section B

Symmetry in Quantum Mechanics:

Unitary operators for space and time translations. Symmetry and degeneracy. Rotation and angular momentum; Commutation relations, eigenvalue spectrum, angular momentum matrices of J_+ , J_- , J_z , J^2 . Concept of spin, Pauli spin matrices. Addition of angular momenta, Clebsch-Gordon coefficients and their properties, recursion relations. Matrix elements for rotated state, irreducible tensor operator, Wigner-Eckart theorem. Rotation matrices and

[Click Here to upgrade to Unlimited Pages and Expanded Features](#)

and time reversal: parity operator and anti-linear operator. harmonic oscillator.

Applications: non-relativistic Hamiltonian for an electron with spin included. C. G. coefficients of addition for $j = 1/2, 1/2; 1/2, 1; 1, 1$.

Section C

Approximation Methods for Bound State:

Time independent perturbation theory for non-degenerate and degenerate systems upto second order perturbation. Application to a harmonic oscillator, first order Stark effect in hydrogen atom, Zeeman effect without electron spin. Variation principle, application to ground state of helium atom, electron interaction energy and extension of variational principle to excited states. WKB approximation: energy levels of a potential well, quantization rules. Time-dependent perturbation theory; transition probability (Fermi Golden Rule), application to constant perturbation and harmonic perturbation. Semi-classical treatment of radiation. Einstein coefficients; radiative transitions.

Books Recommended

1. L. I. Schiff, Quantum Mechanics (McGraw Hill).
2. Eugen Merzbacher, Quantum Mechanics Johan Wiley & Sons Inc.
3. P. M. Mathews and K. Venkatesan, A Text-Book of Quantum Mechanics (TMH)
4. C. Cohen-Tannoudji, Bernard Diu, Franck Loloë, Quantum Mechanics Vols-I&II (John Wiley).
5. J. J. Sakurai, Modern Quantum Mechanics (Addison-Wesley).
6. A. K. Ghatak and S. Lokanathan, Quantum Mechanics 3rd ed. (MacMillan).

NOTE:- In all, 10 questions will be set. Question No. 1 will cover the entire syllabus and will be of objective/short answer type. The remaining 9 questions will be set taking three questions each from Sections A, B and C. The student will attempt 5 questions in all, including question No. 1 (compulsory) and selecting at least one question from each section A, B and C.

	PHYMS-202	No. of hour per semester	52
Name of the course	Condensed Matter Physics		
Duration of the Course	One Semester (13 Weeks)		
Lectures to be Delivered	39 (13 X 3)		
Tutorial	13 (13 X 1)		
Semester End Examination	Total Maximum Marks = 100		Pass Marks
	Theory	MM 80	32
	Internal Assessment	MM 15	06
	Attendance	MM 5	----

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section A

Lattice Vibrations:

Genesis of elastic constants, elastic waves and velocities of waves in cubic crystals, experimental determination.

Dispersion relation of mono-atomic and diatomic chains, frequency distribution function, Van-Hove singularities. Quantization of lattice modes, high temperature and low temperature specific heat of lattice. Inelastic scattering of neutrons by phonons and conservation laws. A harmonic crystal interaction, thermal expansion and Gruneisen parameter. Thermal conductivity; lattice thermal conductivity, Umklapp process.

Free Electron gas:

Free electron gas in three dimensions, idea of periodic boundary conditions and density of states, concept of Fermi surface. Heat capacity of electron gas and its application in metals. Electrical and thermal conductivity of metals. Mathiessen's rule and experimental view point. Motion of free electrons in magnetic field and Hall effect. Boltzmann equation; electrical and thermal conductivity of metals and insulators, thermoelectric effects, Hall effect. Magneto resistance and phonon drag.

Energy Band Theory:

Bloch theorem, electron in periodic potential and square well potential. Empty lattice approximation, concept of effective mass. Distinction between metals, insulators and semiconductors. Semiconductor: band gap, equation of motion, Zone schemes, construction of Fermi surfaces, electron hole and open orbits; Calculation of energy bands; tight binding method, Wigner-Seitz method, pseudo-potentials(qualitative only). Law of mass action in semiconductors, impurity conductivity and impurity states. Thermo-electric effect. Study and construction of Fermi surfaces by cyclotron resonance and de-Hass van Alphen effect.

Superconductivity:

Experimental survey, occurrence, Meissner effect, heat capacity, energy gap, microwave and infrared properties, isotope effect. Theoretical survey; Thermodynamics, London equation, coherence length, BCS theory (qualitative only), BCS ground state. Flux quantization in a superconducting ring, duration of persistent currents. Type II superconductors, vortex state, estimation of H_{c1} and H_{c2} . Josephson tunneling, dc and a. c. Josephson effect, Macroscopic quantum interference.

Section C

Dielectric and Ferroelectric Properties:

Polarization, macroscopic electric field, depolarization field, local electric field at an atom, Lorentz field, field of dipoles inside cavity. Dielectric constant and polarizability Clausius - Mosseti relation. Polarizability (electronic, ionic, dipolar). Classical theory of electronic polarizability, Ferro electric crystals and their classification. Polarization catastrophe, Landau theory of phase transition. Piezo- electricity, anti- ferro electricity, ferro- electric domains, ferro-electricity.

Dielectric function of the electron gas, plasma optics and transparency of alkali metals, plasma oscillation in metals (plasmons).

Non-Crystalline Solids:

Diffraction pattern, amorphous materials, radial distribution function Glasses, viscosity and hopping rate. Amorphous ferro-magnets and semiconductors. Low energy excitation in amorphous solids, heat capacity and thermal conductivity.

Lattice vacancies, diffusion, color centres. Surface and interface physics; crystallography, electronic structure and surface states. Dislocation; shear strength of single crystals, slip, edge ;and screw dislocations. Burgers vector. Dislocation density, crystal growth, strength of alloys, Hume Rothery rules, phase diagrams.

Books Recommended

1. C. Kittel: Introduction to Solid State Physics, VI Edition, (John Wiley and Sons).
2. N. W. Ashcroft and N. D. Mermin: Solid State Physics (H. R. W. International edition).
3. C. A. Wert and R. M. Thomson: Physics of Solids (McGraw Hill)

NOTE:- *In all, 10 questions will be set. Question No.1 will cover the entire syllabus and will be of objective/ short answer type. The remaining 9 questions will be set taking three questions each from Sections A, B and C. The student will attempt 5 questions in all, including question No. 1 (compulsory) and selecting at least one question from each section A, B and C.*

Course Code	PHYMS-203	No. of hour per semester	52
Name of the course	Statistical Physics		
Duration of the Course	One Semester (13 Weeks)		
Lectures to be Delivered	39 (13 X 3)		
Tutorial	13 (13 X 1)		
Semester End Examination	Total Maximum Marks = 100		Pass Marks
	Theory	MM 80	32
	Internal Assessment	MM 15	06
	Attendance	MM 5	----

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section A

The Fundamental Principles of Statistical Physics: Statistical Distributions, Statistical independence, Liouville's theorem, The significance of energy, The statistical matrix, Statistical distribution in quantum statistics, entropy, the law of increase of entropy.

Thermodynamic Quantities: Temperature, Macroscopic motion, Adiabatic processes, Pressure, Work and quantity of heat, The heat function, The free energy and the thermodynamic potential, Relations between the derivatives of thermodynamic quantities, The thermodynamic scale of temperature, The joule-Thomson process, Maximum work, Maximum work done by a body in an external medium, thermodynamic inequalities, Le Chatelier's principle, Nernst's theorem, The dependence of the thermodynamic quantities on the number of particles, Equilibrium of a body in an external field, Rotating bodies, Thermodynamic relation in the relativistic region.

Section B

The GIBBS Distribution: The Gibbs Distribution, The Maxwellian Distribution, The probability distribution for an oscillator, The free energy in the Gibbs distribution, Thermodynamic perturbation theory, Expansion in powers of h , the Gibbs distribution for rotating bodies, the Gibbs distribution for a variable number of particles, The derivation of the thermodynamic relations from the Gibbs distribution.

distribution, The Boltzmann distribution in classical
Ideal gases not in equilibrium, The free energy of an
ideal Boltzmann gas, The equation of state of an ideal gas , Ideal gases with constant
specific heat, The law of equipartition, Monatomic ideal gases, The effect of the
electronic angular momentum.

Non- Ideal Gases: Deviations of gases from the ideal state, Expansion in powers of
the density, Van der Waals formula, relationship of the virial coefficient and the
scattering amplitude, Thermodynamic quantities for a classical plasma, The method of
correlation functions, Thermodynamic quantities for a degenerate plasma. The method of
correlation function, thermodynamic quantities of a degenerate plasma.

Section C

The Fermi And Bose Distributions : The Fermi distribution, The Bose Distribution, ,
Fermi and Bose gases not in equilibrium, Fermi and Bose gases of elementary particles,
A degenerate electron gas, The specific heat of a degenerate electron gas, Magnetism of
an electron gas, Weak fields, and strong fields, A relativistic degenerate electron gas , A
degenerate Bose gas, Black body radiation.

Properties of Matter at Very High Density: The equation of state of matter at high
density, Equilibrium of bodies of large mass, the energy of a gravitating body,
Equilibrium of a neutron sphere.

Books Recommended:

1. L. D. Landau and I. M. Lifshitz: Statistical Physics Third Edition (Part 6 I)
(Pergamon).
2. R. K. Pathria, Statistical Physics (Pergamon).
3. David Chandler: Introduction to Modern Statistical Mechanics (Oxford University Press).
4. R. P. Feynmann: Statistical Mechanics (Addison Wesley).
5. F. Mandl, Statistical Physics (Wiley).
6. C. Kittel, Elementary Statistical Physics (John Willey & Sons)

NOTE:- In all, 10 questions will be set. Question No.1 will cover the entire syllabus and will be of objective/
short answer type. The remaining 9 questions will be set taking three questions each from Sections
A, B and C. The student will attempt 5 questions in all, including question No. 1 (compulsory) and
selecting at least one question from each section A, B and C.

	PHYMS-204	No. of hour per semester	52

	Internal Assessment	MM 15	06
	Attendance	MM 5	----

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section A

Relativistic Electrodynamics:

Space time continuum and four vectors. Light cone. Idea of causal events. Lorentz transformation as orthogonal transformations in 4-dimensions. Four vector formulation of electrodynamics. Electromagnetic field tensor and its invariants. Invariance of Maxwell equations under Lorentz transformations and covariant formulation of Maxwell equations. Lagrangian for the electromagnetic field. Equation of motion of a charged particle in an electromagnetic field.

Section B

Charged Particle dynamics:

Non-relativistic motion in uniform constant fields, non-relativistic motion of a charged particle in a slowly varying magnetic field, adiabatic invariance of flux through an orbit, magnetic mirror. Relativistic motion of a charged particle.

Classical Radiation Theory

Lienard-Wiechert potential, Field of a charge in arbitrary motion, Field produced by a charge in uniform motion, Radiated power from an accelerated charge at low velocities, Larmor's power formula, Radiation from a Charged Particle with collinear velocity and acceleration, radiation from a Charged Particle in circular motion; cyclotron and synchrotron radiation, Bremsstrahlung. Cerenkov radiation. Radiation reaction (damping) and width of spectral line.

Section C

Scattering, Absorption and Dispersion:

Scattering of electromagnetic waves by a free electron and by bound electrons (Thomson scattering and Raleigh scattering), absorption of radiation by a bound electron, electromagnetic theory of dispersion, dispersion in dense media. Causality and dispersion relations: Kramer-Kronig relations.

Plasma Physics

Elementary concepts: Derivation of moment Equations from Boltzmann equation, Plasma Oscillations, Debye Shielding, Plasma parameter, Magnetoplasma, Plasma confinement. Hydrodynamical Description of Plasma: Fundamental equations. Hydromagnetic waves: Magnetosonic and Alfvén waves. Wave Phenomena in Magnetoplasma: Polarization, phase velocity, Group velocity, cut-offs, resonance for Electromagnetic wave propagating parallel and perpendicular to the Magnetic field.

Books Recommended

1. S. P. Puri, Classical Electrodynamics (TMH).
2. J. B. Marion and M. A. Heald, Classical Electromagnetic Radiation, 2nd Ed. (Academic Press).
3. J. D. Jackson, Classical Electrodynamics 3rd. (Wiley Eastern).
4. L. D. Landau and E. M. Lifshitz, The Classical theory of Fields (Pergamon Press).
5. B. G. Levich, Theoretical Physics Vol. I & II (NH).

NOTE:- In all, 10 questions will be set. Question No.1 will cover the entire syllabus and will be of objective/ short answer type. The remaining 9 questions will be set taking three questions each from Sections A, B and C. The student will attempt 5 questions in all, including question No. 1 (compulsory) and selecting at least one question from each section A, B and C.

	Theory	MM 80	32
	Internal Assessment	MM 15	06
	Attendance	MM 5	----

Course X: LABORATORY

Note: Students are expected to do as many experiments as possible but not less than 10 experiments out of the following list doing 3 experiments from each of the sections A, B and C. Internal assessment for the laboratory course will be based on a seminar, number of experiments performed and checked after thorough viva based on the each experiment conducted by the concerned teacher/s during the semester and attendance. Marks will be posted in the copy and on the index of the copy. A record of the same will be kept in the laboratory also.

General

1. Susceptibility of a given salt by Quincke's method.
 2. B-H curve of a given material and to determine its parameters.
 3. Band gap of a semiconductor by Four Probe Method.
 4. Ultrasonic wave velocity in liquids by interferometer method.
 5. Stefan's constant.
 6. Susceptibility by Gouy's method.
 7. Solar cell characteristics.
 8. Dielectric constant of a liquid by dipole meter.
 9. Ionization potential of mercury/ neon.
 10. Wave velocity and attenuation in solids by pulse method.
 11. Determination of specific heat of graphic at different temperatures.
 12. Study of variation of modulus of rigidity and internal friction of a specimen rod with temperature.
 13. Study of tunnel diode and Zener diode.
 14. Study of frequency response of amplifiers.
 15. Study of Oscillator circuits
- Computer based experiments**
16. Semi classical quantization of molecular vibration.
 17. Scattering by a central potential.
 18. Solution of ordinary differential equation and application to order and Chaos in two dimensional motion.
 19. Structure of white dwarf stars.

square well potential.
and tunneling effect.

22. Study of Ising model using monte carlo method

M.Sc. PHYSICS (2nd SEMESTER): LABORATORY / PRACTICAL COURSE

1. Experiment on FET and MOSFET characterization and application as an amplifier.
2. Experiment on Uni-Junction Transistor and its applications.
3. Digital I: Basic Logic Gates, TTL, NAND and NOR
4. Digital II : combinational Logic
5. Flip-Flops.
6. Operational Amplifier (741).
7. Differential Amplifier.
8. Measurement of resistivity of a semiconductor by four probe method at different temperatures and Determination of band gap.
9. Determination of Lande's factor of DPPH using Electron Spin Resonance (ESR) spectrometer.
10. Measurement of Hall coefficient of given semiconductor: Identification of type of semiconductor and estimation of charge carrier concentration.
11. To study the fluorescence spectrum of DCM dye and to determine the quantum yield of fluorescence maxima and full width at half maxima for this dye using monochromator.
12. To study Faraday effect using He-Ne-Laser.

M.Sc. Physics (2nd Semester): Tutorial : Laboratory / Practical Course

This is only a suggestive list, the faculty concerned can add more topics as per the need of the students

1. Effect of capacitance and load resistance on output of an amplifier.
2. Integrated circuit timer familiarization.
3. Op-amp differentiator.
4. Multiplexers and Demultiplexers.
5. Registers and Counters
6. Radiation level and activity measurement.
7. Shielding, mass absorption coefficient.
8. Coincidence circuits, counters, timers.
9. Coherence and its relevance in diffraction.
10. Identification of charge type by Hall voltage measurement.
11. How does four probe method solve the problem of contact resistance?

	PHYMS-206	No. of hour per semester	52
Name of the course	COMPUTER APPLICATIONS IN PHYSICS (Nodal Centre based course)		
Duration of the Course	One Semester (13 Weeks)		
Lectures to be Delivered	39 (13 X 3)		
Tutorial	13 (13 X 1)		
Semester End Examination	Total Maximum Marks = 100		Pass Marks
	Theory	MM 80	32
	Internal Assessment	MM 15	06
	Attendance	MM 5	---

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section A

Recent trends:

Multimedia and its applications. Essentials of a web page, HTML and its features Essentials of parallel computation and features of parallel programming.

Section B

Object Oriented Programming (C++):

OOP fundamentals: objects, classes, encapsulation, abstraction, inheritance, polymorphism, reusability, overloading.

Structure of a C++ program:

Variables, data types, identifiers, declaration of variables, scope of variables, initialization of variables, strings as non-numerical variables, constants. Operators. Basic input/output functions. Control structure: if and else, for, while, do while, break, continue, goto, exit, switch. Functions, scope of variable in a function, void, argument passing (by value, by reference) overloaded functions), void, inline function, recursivity, declaring functions. Arrays: initializing arrays, multidimensional arrays, arrays as parameters, character sequences: null terminated character sequences. Pointers: reference operator (&), de-reference operator (*), declaring variables of pointer types, pointers and arrays, pointer initialization, pointer arithmetic, pointers to pointers, void pointers, null pointers, pointers and

structures, nesting structures, other data types (typedef,

Classes, function templates and preprocessor directives: Classes, constructors and destructors, overloading constructors, deconstructors, overloading constructor, default constructor, pointers to classes, classes defined with struct and union. Overloading operator, keyword this, static members, Friendship function, friend classes, inheritance between classes, multiple inheritance. Polymorphism, pointers to base class, virtual number, abstract base classes, Function templates, class templates, template specialization, name space alias, std, exceptions. Type casting. Preprocessor directives

Section C

Applications III:

Initial value and boundary value problems (2-dim), Matrix operations, inversion, eigen functions and Eigen values. Monte Carlo method: Basic strategy, generating random numbers, evaluation of two and three dimensional integrals.

Programming exercises (at least ten).

NOTE:- In all, 10 questions will be set. Question No.1 will cover the entire syllabus and will be of objective/ short answer type. The remaining 9 questions will be set taking three questions each from Sections A, B and C. The student will attempt 5 questions in all, including question No.1 (compulsory) and selecting at least one question from each section A, B and C.

Computer applications: Exercises (suggested) on COURSE II to be implemented in Nodal Center for Computer Applications

Developing following basic programs in C++

1. Inversion of matrix
2. Diagonalization, eigenvalue and eigen functions
3. Solution of oscillator (undamped and damped) problem
4. Motion of a projectile
5. Initial value problems Boundary value problems (2 and 3-dim)
6. MC method: generation of random numbers
7. Evaluation of two dimensional integral
8. Evaluation of three dimensional integrals.

the electromagnetic oscillations in an LCR circuit using

10. To study phase trajectory of a chaotic pendulum
11. Use Monte Carlo method to study nuclear radioactivity and modifying it to include the case of an unstable daughter nuclei.
12. To study the motion of a satellite around earth under central force field.

Note on COURSE I, II on Computer Applications in Physics

1. Both these courses are pre-requisite to the main course.
2. Admission to these courses be made at the time of admission to M.Sc.
3. Exemption is allowed only to those students who have the requisite background.
4. Students in these courses be examined at the end of the year
5. These courses must be cleared by the students, marks scored in these will not be counted towards division.

SEMESTER III

Course Code	PHYMS-301	No. of hour per semester	52
Name of the course	Quantum Mechanics - II		
Duration of the Course	One Semester (13 Weeks)		
Lectures to be Delivered	39 (13 X 3)		
Tutorial	13 (13 X 1)		
Semester End Examination	Total Maximum Marks = 100		Pass Marks
	Theory	MM 80	32
	Internal Assessment	MM 15	06
	Attendance	MM 5	---

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section A

Scattering Theory:

General considerations; kinematics, wave mechanical picture, scattering amplitude, differential and total cross-section. Green's function for scattering. Partial wave analysis: asymptotic behaviour of partial waves, phase shifts, scattering amplitude in terms of phase shifts, cross-sections, Optical theorem. Phase shifts and its relation to potential, effective range theory. Application to low energy scattering; resonant scattering, Breit-Wigner formula for one level and two levels, non-resonant scattering. s-wave and p-wave resonances. Exactly soluble problems; Square-well, Hard sphere, coulomb potential. Born approximation; its validity, Born series.

Section B

Identical Particles:

The Schrodinger equation for a system consisting of identical particles, symmetric and anti-symmetric wave functions, elementary theory of the ground state of two electron atoms; ortho-and para-helium. Spin and statistics connection, permutation symmetry and Young tableaux. Scattering of identical particles.

on:

Generalization of the Schrodinger equation; Klein-Gordon equation, plane wave solutions, charge and current densities, interaction with electromagnetic fields, Hydrogen-like atom (to show it does not yield physical spectrum), non-relativistic limit. Extension of Klein-Gordon equation to spin 1 particles.

Section C

Relativistic Dirac Equation:

Dirac Equation; relativistic Hamiltonian, probability density, expectation values, Dirac gamma matrices, and their properties, non-relativistic limit of Dirac equation. Covariance of Dirac equation and bilinear covariance, plane wave solution, energy spectrum of hydrogen atom, electron spin and magnetic moment, negative energy sea, hole interpretation and the concept of positron. Spin-orbit coupling, hyperfine structure of hydrogen atom.

Quantization of wave fields: The procedure for quantization of wave fields, quantization of non-relativistic Schrod-inger equation, second quantization, N-representation creation and annihilation operators.

Books Recommended

1. P. M. Mathews and K. Venkatesan, A Text book of Quantum Mechanics (TMH)
2. A. S. Davydov, Quantum Mechanics (Pergamon).
3. L. I. Schiff, Quantum Mechanics (McGraw Hill).
4. J. D. Bjorken and S. D. Drell, Relativistic Quantum Mechanics (McGraw Hill).
5. J. J. Sakurai, Advanced Quantum Mechanics (Addison Wesley).

NOTE:- In all, 10 questions will be set. Question No.1 will cover the entire syllabus and will be of objective/ short answer type. The remaining 9 questions will be set taking three questions each from Sections A, B and C. The student will attempt 5 questions in all, including question No. 1 (compulsory) and selecting at least one question from each section A, B and C.

	Attendance	MM 5	----

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section A

Magnetic Properties:

Langevin theory of diamagnetism, quantum theory of para-magnetism (rare earth, Hund's rule, Iron group ions). Crystal field splitting and quenching of orbital angular momentum. Cooling by adiabatic demagnetization of a paramagnetic salt. Nuclear demagnetization. Paramagnetic susceptibility of conduction electrons.

Ferro and anti ferromagnetic order and molecular field theory. Exchange interaction, classical derivation of spin wave dispersion relations in ferro, anti-ferromagnetic systems and thermodynamic properties.

Ferromagnetic domain, anisotropy energy and Block wall. Coercive force and hysteresis, magnetic bubble domains.

Nuclear magnetic resonance and relaxation times. Ferro and anti-ferromagnetic resonance. Principle of Maser action, three level maser, Ruby laser. Semiconductor junction lasers.

Section B

Phase Diagrams and Phase Transformation

Definitions and Basic concepts: solubility limit, phase, microstructure, phase equilibria, one-component phase diagrams, Binary phase diagrams: binary isomorphous systems, interpretation of phase diagrams, development of microstructure in isomorphous alloys and their mechanical properties, binary eutectic systems and development of microstructure in

ms having intermediate phases, eutectoid and peritectic transformations, ceramic and ternary phase diagram, the Gibbs phase rule, Phase transformations. basic concepts, the kinetics of phase transformations, metastable versus equilibrium states, isothermal and continuous cooling transformation diagrams and tempered martensite

Section C

Materials Characterization Techniques

Principles of X-ray Photometry Spectroscopy (XPS) and Auger electron Spectroscopy (AES), Instrumentation, Routine limits of XPS, Applications of XPS & AES.

Scanning Tunneling Microscopy (STM): Working principle, Instrumentation, Modes of operation

Atomic Force Microscopy (AFM): Introduction, Working Principle Instrumentation Modes of operation Difference between STM and AFM

X-ray Characteristics and Generation, lattice planes and Bragg's law, Powder diffraction, Transmission Electron Microscopy (TEM) : Basic of TEM, Reciprocal Lattice, Specimen Preparation Bright Field and Dark Field Images Electron energy Loss Spectroscopy. Scanning Electron Microscopy: Introduction, Infrared (IR) spectroscopy, Ultraviolet (UV) and visible spectroscopy. Mössbauer Spectroscopy Basic theory, experimental set up and Mössbauer parameters.

Books Recommended

Marks will be posted in the copy and on the index of the copy. A record of the same will be kept in the laboratory also.

Section A

1. Michelson Interferometer and thickness of mica sheet
2. Fabry-Perot Interferometer.
3. G. M. Counter (a) characteristics (b) dead time (c) statistical distribution of counting rate.
4. End point energy of beta spectrum.
5. Proportional counter and low energy gamma ray measurements.
6. Hall effect.
7. Lecher wire: dielectric constant of a solid and a liquid.
8. Magneto resistance.
9. Determination of specific heat of solids (metals and alloys).
10. Fourier analysis of a complex signal.
11. Simulation of lattice dynamics of a mono-atomic and diatomic lattice.
12. Determining the laser beam characteristics (power distribution, beam spot size, divergence of laser beam, depth of field, beam waist, quality of laser beam, spatial coherence of beam)
13. Fraunhofer diffraction (single slit, double slit, circular aperture)
14. Determining thickness of a thin wire by diffraction using laser beam
15. Measure the wave length of laser light with transmission grating.
16. Measurement of thread angle, pitch and diameter of screw using laser beam
17. Study reflection, laws of reflection, internal reflection, critical angle, index of refraction of glass, index of refraction of prism, multiple internal reflection in glass and interference

12. Characteristics of lumped transmission line.
13. Modulation and demodulation: A.M. and F.M.
14. Designing and study of OPAMP: characteristic and parameter measurements.
15. OPAMP as (a) an active filter and frequency response (b) basic mathematical operations using OPAMP.
16. Study of multi vibrators (a) a stable (b) bi-stable (c) mono-stable.

17. Study of polarization using laser beam (measurement of state of polarization of light wave, measurement of Brewster's angle of glassplate, verification of Malus's law)
18. To study magneto-optic rotation and magneto optic modulation.
19. To create hologram of a given object

Section C

(Computer based experiments)

17. Boundary value and eigen-value problems.
 - (a) stationary solution of one dimensional Schrodinger equation
 - (b) atomic structure in HF approximation.
18. Special functions and Gaussian quadrature: (a) partial wave solution of quantum scattering (b) Born and eikonal approximation in quantum scattering.
19. Plotting of radial eigen function of harmonic oscillator.
20. Fast Fourier transforms of some simple functions.
21. Simulation of an order disorder phase transition for a three states Potts model

UGC M.Sc. Physics (III Semester): Laboratory/Practical Course

(a) CONDENSED MATTER PHYSICS

1. Measurement of lattice parameters and indexing of powder photographs.
2. Interpretation of transmission Laue photographs.
3. Determination of orientation of a crystal by back reflection Laue method.
4. Rotation/oscillation photographs and their interpretation.
5. To study the modulus of rigidity and internal friction in metals as a function of temperature.
6. To measure the cleavage step height of crystal by Multiple Fizeau fringes.
7. To obtain Multiple beam Fringes of Equal Chromatic order. To determine crystal step height and study birefringence.
8. To determine magnetoresistance of a Bismuth crystal as a function of magnetic field.
9. To study hysteresis in the electrical Polarization of a TGS crystal and measure the Curie temperature.
10. To measure the dislocation density of a crystal by etching.

(a I) CONDENSED MATTER PHYSICS

1. Study of X-ray diffraction from liquid, amorphous materials.
2. Determination of dislocation density by Reflection X-ray topography.
3. To take Bragg Precession photograph of a crystal and index the reflections.

...tivity transition temperature and transition width of high-
s.

5. To determine the optical constants of a metal by reflection of light.
6. Model evaluation of dispersion curves of one-dimensional lattice.

(b1) ELECTRONICS

1. Pulse Amplitude Modulation/Demodulation
2. Pulse position/Pulse Width Modulation/Demodulation
3. FSK Modulation Demodulation using Timer/PLL
4. Microwave characterization and Measurement
5. PLL Circuits and applications
6. Fibre Optics communication
7. Design of Active filters
8. BCD to Seven Segment display
9. A/D and D/A conversion
10. Experiments using various types of memory elements
11. Addition, Subtraction, Multiplication & Division using 8085/8086
12. Wave form generation and storage oscilloscope
13. Frequency, Voltage, Temperature measurements
14. Motor Speed control., Temperature control using 8086.
15. Trouble shooting using signature analyzer.
16. Assemble language programming on PC.
17. Experiments based on computer Aided Design.

Setting up of new experiments will form tutorial for this laboratory course.

(C I) NUCLEAR AND PARTICLE PHYSICS

1. To determine the operating voltage, slope of the plateau and dead time of a G.M. counter.
2. Feathersø analysis using G.M. Counter.
3. To determine the operating voltage if a óphotomultiplier tube and to find the photopeak efficiency of a NaI (Tl) crystal of given dimensions for gamma rays of different energies.
4. To determine the energy resolution of a NaI(Tl) detector and to show that it is independent of the gain of the amplifier.
5. To calibrate a gamma ray spectrometer and to determine the energy of given gamma ray source.
6. To determine the mass attenuation coefficient of gamma rays in a given medium.
7. To study the Compton scattering using gamma rays of suitable energy.
8. To study the various modes in a multichannel analyzer and to calculate the energy resolution, energy of gamma ray.
9. To determine the beta ray spectrum of Cs-137 source ad to calculate the binding energy of k- Shell electron of Cs-137.
10. To study the Rutherford scattering using aluminum as scatterer and Am-241 as a source.
11. To measure the efficiency and energy resolution of a HPGe detector.
12. Alpha spectroscopy with surface barrier detector ó Energy analysis of an unknown gamma source.
13. Determination of the range and energy of alpha particles using spark counter.

and low energy X-ray measurements.
Proportional counter.

16. Neutron activation analysis.
17. Gamma γ gamma coincidence studies.
18. Identification of particles by visual range in nuclear emulsion.
19. Construction and testing of a single channel analyzer circuit.
20. Decoding and display of the outputs from the IC μ 7490.
21. To observe Mossbauer effect in a nonmagnetic and a magnetic environment and to deduce nuclear magnetic moments.

K. Sriram and Y.R.Waghmare, Introduction to Nuclear Science and Technology, A.M. Wheeler, 1991.

Nicholson, nuclear Instrumentation.

(e) NUCLEAR AND PARTICLE PHYSICS

1. Mounting a Scintillation Crystal to a Photomultiplier Tube.
2. Pulse Cable making
3. Pulse Shaping with an RC Circuit and to Display with an Oscilloscope.
4. Training in the Usage of oscilloscope and Electronic Meters μ Sensitivity and Resolutin Study.
5. Usage of Radiation Monitors.
6. Setting up the Gamma Ray spectrometer
7. Photoelectric Effect, Compton Effect, Pair Production and Back Scattering
8. Discriminators
9. Pulse height as a Function of Applied Voltage for Gas Counters
10. Proportional Counter Characteristics
11. Scintillation Process in Intrinsic and Extrinsic Inorganic Crystals and Organic Crystals
12. Signal Formation in Solid State Devices
13. Neutron Activation Analysis

SEMESTER IV

Course Code	PHYMS-401		No. of hour per semester	52
Name of the course	Electronics –II			
Duration of the Course	One Semester (13 Weeks)			
Lectures to be Delivered	39 (13 X 3)			
Tutorial	13 (13 X 1)			
Semester End Examination	Total Maximum Marks = 100		Pass Marks	
	Theory	MM 80	32	
	Internal Assessment	MM 15	06	
	Attendance	MM 5	---	

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section A:

Analog and Digital System: Analog Computation, Active Filters, Comparators, Logarithmic and Anti-Logarithmic Amplifiers, Sample and Hold Amplifiers, Waveform Generators, Square and Triangular Wave Generators, Pulse Generators. Read only Memory (ROM) and Applications, Random Access Memory (RAM) and applications, Digital to Analog Converters, Ladder and weighted type Analog to Digital Converters, Counter type, Successive Approximation and Dual Slope Converters, Application of Digital to Analog converter (DACs) and Analog to Digital Converter (ADCs)

Section B:

Digital Communications

Pulse-Modulation Systems: Sampling Theorem, Low-Pass and Band-Pass signals, PAM, Channel BW for a PAM Signal, Flat-top sampling, Signal recovery through Holding, Quantization of Signals, Quantization, Differential PCM, Delta Modulation, Adaptive Delta Modulation Continuously Variable Slope Delta Modulator (CVSD).

Digital Modulation Techniques: Binary Phase-Shift Keying (BPSK), Differential Phase-Shift Keying (DPSK), Quadrature Phase-Shift Keying (QPSK), Phase-Shift Keying (PSK), Quadrature Amplitude Shift Keying (QASK), Binary frequency Shift Keying (BFSK), Frequency Shift Keying (FSK), Minimum Shift Keying (MSK).

Fabrication of Integrated Devices: Thin Films Deposition Techniques: Vacuum Pump and Gauges-Pumping Speed throughout, Effective Conductance Control, Chemical Vapor Deposition (CVD), MOCVD, PEMOCVD (Plasma Enhanced Chemical Vapor Deposition), Physical Vapor Deposition: Thermal Evaporation, Molecular Beam Epitaxy (MBE), Sputtering, Laser Ablation, Chemical Solution Techniques: Sol gel, Hybrid, Metal Organic. Lithography, Etching and Micro-machining Silicon, Fabrication of Integrated Circuits and Integrated Micro-Electro-Mechanical Systems (MEMS).

Text and References Books

1. Microelectronics by Jacob Millman, Megraw-Hill International Book Co. New Delhi, 1990.
2. Taub and Schilling, Principles of Communication Systems, Second Edition, TMH, 1994.
3. Thin Films Phenomenon by K.L. Chopra
4. The material Science of Thin films, Milton S. Ohning.
5. Deposition Techniques for films and coating R.F. Bunshah (Noyes Publications).

NOTE:- In all, 10 questions will be set. Question No. 1 will cover the entire syllabus and will be of objective/short answer type. The remaining 9 questions will be set taking three questions each from Sections A, B and C. The student will attempt 5 questions in all, including question No. 1 (compulsory) and selecting at least one question from each section A, B and C.

Course Code	PHYMS-402(a)	No. of hour per semester	52
Name of the course	Advanced High Energy Physics		
Duration of the Course	One Semester (13 Weeks)		
Lectures to be Delivered	39 (13 X 3)		
Tutorial	13 (13 X 1)		
Semester End Examination	Total Maximum Marks = 100		Pass Marks
	Theory	MM 80	32
	Internal Assessment	MM 15	06
	Attendance	MM 5	----

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section: A

Symmetries and Conservation Laws, Noether's theorem, U(1) gauge invariance baryon and Lepton Number Conservation Global and Local Gauge Invariance, Spontaneous Breaking of Global gauge invariance, Goldstone Bosons, Higgs Mechanism, Generalized Local gauge invariance, Abelian and Non Abelian gauge invariance.

Section : B

Weinberg- Salam Theory of Electroweak Unification , the matter fields, the gauge fields, The gauging of SU (2) X U (1), the Vector Bosons, the fermion sector, Helicity States, Fermion Masses, Fermion Assignments in the electroweak model, Spontaneous Symmetry Break down , Fermion Mass Generation, the Color gauge theory of Strong interactions.

Section : C

SU (5) Grand Unified Theory, the generators of SU (5), The Choice of fermion representations Spontaneous Breaking of SU (5) Symmetry Fermion Masses and Mixing Angles, the Classic Predictions of SU(5) Grand Unified Theory Quark- lepton Mass Relations in SU(5).

2. Modern Elementary Particles Physics, G.L.Kane (Addison Wesley).
3. Gauge Theories of Strong, Weak and Electromagnetic Interactions C. Quigg (Addison- Wesley)
4. Grand Unified Theories Graham Ross (Addison Wesley)
5. Gauge theory of Elementary Particles Physics, P.P. Cheng and Ling Fong Li.
6. Gauge Field Theories, Paul H. Frampton (Addison Wesley)
7. Gauge Field theories J. Leite Lopes, Pergamon Press.

NOTE:- In all, 10 questions will be set. Question No.1 will cover the entire syllabus and will be of objective/ short answer type. The remaining 9 questions will be set taking three questions each from Sections A, B and C. The student will attempt 5 questions in all, including question No. 1 (compulsory) and selecting at least one question from each section A, B and C.

	PHYMS-402 (b)	No. of hour per semester	52
Name of the course	Nuclear & Particle Astrophysics		
Duration of the Course	One Semester (13 Weeks)		
Lectures to be Delivered	39 (13 X 3)		
Tutorial	13 (13 X 1)		
Semester End Examination	Total Maximum Marks = 100		Pass Marks
	Theory	MM 80	32
	Internal Assessment	MM 15	06
	Attendance	MM 5	----

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week

Section: A

The observational basis of Nuclear Astrophysics, The importance of the four fundamental interactions, A Brief Description of the Observed Universe, The Origin of the Universe: The Hadron Era, the Lepton Era, The Radiation Era; the Stellar Era: Stellar Evolution: the Hertzsprung- Russel Diagram, Evolution of Stars: The Chemical Composition of the Observable Universe, Techniques for Abundance Determination: The Direct and Indirect Methods; The Abundances of Elements in the Universe, The main Sequence Stars.

Section: B

Thermonuclear and Nuclear Reactions in Stellar Interiors; Nuclear Reactions: Generalities; Nuclear Reaction Rates; Hydrogen burning: The Proton Proton chain or PPI Chain, the Proton chains with a He Catalyst or PP II and PP III Chains; The CNO Cycle, Helium burning, Hydrostatic C,O and Si Burning Explosive Nucleosynthesis in stars, Supernovae: the Fe Photodisintegration Mechanism, the C Detonation Mechanism, The Neutrino Transport Mechanism, Deceleration of the Central Pulsar, The Helium Flashes, the Novae Outbursts Explosions of Supermassive Stars, The Explosive Nucleosynthesis Explosive Burning in H and He burning Zones, Explosive Nucleosynthesis in C,O and Si burning Zones, Formation of the heavy Elements, Abundances of the Heavy Elements- Processes of Neutron Capture, Neutron Capture Reactions. The S-process, the main Neutron Sources for the S-process, The S-process Nucleosynthesis; the r-process; The p-process: Weak Interaction Mechanism Spallation Reactions, thermonuclear Reactions.

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section : A

Bulk Nanostructured Materials

Solid Disordered Nanostructures: Methods of synthesis, Failure Mechanism of Conventional Grain-Sized Materials, Mechanical Properties, Nanostructured Multilayers, Electrical Properties, Other properties, Metal Nanocluster Composite Glasses, Porous Silicon

Nanostructure Crystals: Natural Nanocrystals, Computational Prediction of Cluster Lattices, Arrays of Nanoparticles in Zeolites, Crystals of Metal Nanoparticles, Nanoparticle Lattices in Colloidal Suspensions, Photonic Crystals

Section : B

Nanostructures Ferromagnetism

Basic of ferromagnetism, Effect of Bulk nanostructuring of Magnetic properties, Dynamics of nanomagnets, Nanopore Containment of magnetic particles, Nanocarbon ferromagnets, Giant and colossal Magnetoresistance, Ferrofluids

Quantum Wells, Wires, and Dots

Introduction, Preparation of Quantum Nanostructures, Size and Dimensionality effects: size effect, conduction electrons and dimensionality, Fermi gas and Density of States, Potential wells. Partial confinement, properties dependent and density of states.

Physical methods)

Physical methods based on evaporation, sputter deposition, chemical vapour deposition, electric arc deposition, ion beam techniques (ion implantation), Molecular beam epitaxy (MBE)

Section : C

Synthesis of Nanomaterials-I (Chemical methods)

Introduction, Colloids and Colloids in solutions, Growth of Nanoparticles, Synthesis of Metal Nanoparticles by Colloidal Route, Synthesis of semiconductor nanoparticles by colloidal route, Langmuir-Blodgett (L-B) methods, microemulsions, sol-gel method

Some special nanomaterials

Introduction, Carbon nano tubes, ordered porous materials using micelles as templates, self assembled nanomaterials, core shell particles.

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section: A

Preliminary concepts: Two dimensional electron gas, effective mass, density of states, characteristic lengths, low and high field magneto resistance, transverse modes, drift velocity, fermi velocity

Conductance from transmission: Resistance of ballistic galvanometer, Landauer Formula, Landauer buticker formalism

Transmission function, S-matrix and green's functions, tight binding model, self energy, relation to other formalisms, feynman paths

Section: B

Quantum hall effect, origin of zero resistance, effect of back scattering Brief remarks on fractional quantum hall effect.

Localization and fluctuations: localization length, weak localization, effect of magnetic field, conductance fluctuations, diagrammatic perturbation theory

Double barrier tunneling: coherent resonant tunneling, effect of scattering, single electron tunneling

Section: C

Optical analogies: Electrons and phonons: conceptual similarities, linear optics, non-linear optics, coherent sources

Non-equilibrium green function formalism: correlation and scattering functions, self energy and green's function, kinetic equation, calculating the self energy, solution procedure, current

Section A

Concepts of deterministic and stochastic simulation methods, limitations of simulational physics, percolation, percolation threshold, cluster labeling, critical exponents, fractal dimension, regular fractals and self similarity, fractal growth processes. One particle system moving in a spring potential.

Monte Carlo Method (Stochastic Methods)

Random walk on one, two and three dimensional lattices, self-avoiding walk, micro-canonical ensemble monte carlo method (Case Study: one dimensional ideal gas, Ising Model, heat flow), Canonical ensemble monte carlo method (Metropolis method, classical ideal gas, ising model, hard rods), isothermal-isobaric ensemble monte carlo method, grand-canonical ensemble monte carlo method

Section B

Molecular Dynamics (Deterministic Methods)

Molecular Dynamics as deterministic simulation, integration schemes (euler, predictor corrector, verlet), calculating thermodynamic quantities, organization of simulation, microcanonical ensemble molecular dynamics (case study: monoatomic particle system interacting via lennard jones potential), canonical ensemble molecular dynamics (case study: isokinetic simulation of a system of monoatomic particle system using lennard jones potential), isothermic-isobaric ensemble molecular dynamics (case study: simulation of a

them using lennard jones potential at constant temperature
 version of Anderson scheme and Nose scheme.

Section C

Symbolic Computing:

Symbolic Computing Systems, Basic symbolic mathematics, computer calculus, Linear systems, Non-linear systems, Differential equations, Computer graphics, Dynamics of a flying sphere. Basics of Mathematica: numerical computations, algebraic computations, calculus, graphics, Procedural programming

High Performance Computing: The basic concept, High performance computing systems Parallelism and Parallel computing, Data parallel programming, Distributed computing and message passing, Some current applications.

Computing Hardware Basics: Memory and CPU

Components: Memory Hierarchy, The Central Processing unit

CPU Design: RISC, CPU Design; Vector Processing, Virtual Memory, Programming for virtual memory, Programming for Data Cache.

12. An Introduction to Computer Simulation, Woolfson and Pert, Oxford
13. Computational Physics, Thijssen, Cambridge (Advanced and quite specialised)
14. Computational Techniques in Physics, MacKeown & Newman, Adam Hilger

FORTRAN, 2nd Edition, Press et al. Cambridge (An advanced

16. H. GOULD and J. TOBOCHNIK "An Introduction to Computer Simulation Methods: Application to Physical Systems, Parts 1 and 2 " or the single volume 2nd edition
17. W. H. PRESS, B. P. FLANNERY, S. A. TEUKOLSKY and W. T. VETTERLING, "Numerical Recipes", Cambridge University Press, 1986 (1st or 2nd editions, Fortran, C or C++ only).
18. Mathematica, S Wolfram, Addison Wesley Pub Co.

NOTE:- In all, 10 questions will be set. Question No.1 will cover the entire syllabus and will be of objective/short answer type. The remaining 9 questions will be three each from sections A, B and C. The students will attempt 5 questions in all; including question No.1 (compulsory) and at least one from each section

	PHYMS-404 (a)	No. of hour per semester	52
Name of the course	Advanced Nuclear Physics		
Duration of the Course	One Semester (13 Weeks)		
Lectures to be Delivered	39 (13 X 3)		
Tutorial	13 (13 X 1)		
Semester End Examination	Total Maximum Marks = 100		Pass Marks
	Theory	MM 80	32
	Internal Assessment	MM 15	06
	Attendance	MM 5	---

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section: A

Angular Momentum Theory: Angular momentum coupling: coupling of two angular momenta, coupling of three angular momenta, coupling of four angular momenta Racah coefficients. Tensors and reduced matrix elements of irreducible operators, Product of tensor operators. Application: Spherical harmonics between orbital angular momentum states, Spin operator between spin states, Angular momentum J between momentum states, Matrix elements element of compounded states and Matrix elements between angular momentum coupled state.

Nuclear Decays: Decay widths and lifetimes. Alpha Decay: General Properties and theory of alpha decay, Barrier penetration of alpha decay, alpha decay spectroscopy Spontaneous fission decay Beta Decay: General Properties, Neutrinos and Antineutrinos, the Fermi theory of beta decay, Angular momentum and selection rules of beta decay, electron capture, beta spectroscopy. Gamma decay, reduced transition probabilities for gamma decay, Weisskopf units for gamma decay.

Section: B

The Fermi gas model, The one body potential General properties, The harmonic oscillator potential separation of intrinsic and centre-of-mass motion, the kinetic energy and the harmonic oscillator. Conserved quantum numbers, angular momentum, parity and isospin, Quantum number for the two nucleon system, two proton or two neutron, and proton and neutron.

The Hartree Fock Approximation Properties of single Slater determinants, Derivation of the Hartree-Fock equations, examples of single particle energies, Results with Skyrme Hamiltonian: Binding energy, single particle energies, Rms charge radii and charge densities.

of nuclei, Static electromagnetic moments of nuclei, Electromagnetic transition probability on shell model, Exact treatment of two-nucleons by shell model, two-nucleon wave function, matrix elements of one-body operator and two-body potential, Shell model diagonalization, Configuration mixing, relationship between hole state and particle state, State of hole-particle excitation and core polarization, Seniority and fractional percentage by second-quantization technique.

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section: A

The interaction of radiation with matter: Introduction, Heavy charged particle interactions, electron interactions. Gamma rays interactions:- photoelectric effect, Compton scattering, pair production and attenuation. Neutrons interactions:- moderation, nuclear reaction and elastic and inelastic scattering.

Detectors and Instrumentation: Introduction, Gas detectors: ionization chamber, proportional counter, and Geiger-Mueller counter. Scintillation counters. Semiconductor Detectors, Neutrons detectors

Biological Effects of radiation: Initial interactions, Dose, dose rate and dose distribution, Damage to critical tissue, Human exposure to radiation and Risk assessment.

Section: B

Industrial and Analytical Applications: Industrial uses:- Tracing, Gauging, material modification sterilization, food preservation. Neutron activation analysis, Rutherford backscattering, particle induced X-ray Emission Accelerator Mass spectroscopy

Nuclear Medicine: Projection Imaging: X-Radiography and the Gamma Camera, Computed Tomography, Positron Emission Tomography (PET), Magnetic resonance Imaging (MRI), Radiation Therapy.

Mossbauer Spectroscopy: Resonant absorption of gamma rays, the Mossbauer effect, Application: nano material spectroscopy and nuclear spectroscopy.

Nuclear Energy Power from Fission: Characteristic of fission, The chain Reaction in a thermal fission reactor, the reactor, reactor operation, commercial thermal reactions, the breeder reactor, accelerator driven systems

Power from Fusion: Thermonuclear reaction and energy production, Fusion in hot medium, progress towards fusion power, fusion in early universe, stellar burning The p-p chains, Beyond hydrogen burning, and nucleosynthesis: Production of light elements (up to Fe), Production of the heavy elements - supernovae

Recommended Books and Course Materials

1. Lilley ó Nuclear Physics ó Principles and Applications. *Good general text covering most of the course.*
2. Krane - Introductory Nuclear Physics. *Covers most of the course in variable level of detail.*
3. Leo - Techniques for Nuclear and Particle Physics Experiments. *A lot of practical detail.*
4. Murray - Nuclear Energy. *Good general text on fission and fusion.*
5. Bowers & Deeming - Astrophysics I (Stars). *Covers solar nuclear physics.*
6. Roth & Poty - Nuclear Methods of Dating. *For radiocarbon and geological dating.*
7. Webb - The Physics of Medical Imaging, 1988. *Covers the nuclear imaging methods in adequate detail.*

NOTE:- In all, 10 questions will be set. Question No.1 will cover the entire syllabus and will be of objective/short answer type. The remaining 9 questions will be three each from sections A, B and C. The students will attempt 5 questions in all; including question No.1 (compulsory) and at least one from each section

	PHYMS-404 (C)	No. of hour per semester	52
Name of the course	Opto - Electronics		
Duration of the Course	One Semester (13 Weeks)		
Lectures to be Delivered	39 (13 X 3)		
Tutorial	13 (13 X 1)		
Semester End Examination	Total Maximum Marks = 100		Pass Marks
	Theory	MM 80	32
	Internal Assessment	MM 15	06
	Attendance	MM 5	----

Note: Internal Assessment on the basis of two house tests (one in the middle of the semester i.e. 7th week and the second at the closing of the semester i.e. 14th week)

Section-A

Injection luminescence: Recombination processes, the spectrum of recombination radiations, Direct and Indirect band gap Semiconductors, The Internal Quantum Efficiency, The External Quantum Efficiency

The basic principles of laser actions: spontaneous and stimulated emission and absorption, the condition for the laser action, Types of laser, Semiconductor lasers;

Theory of Laser action in Semiconductors, condition for gain, The threshold conditions for oscillations, rates of spontaneous and stimulated emission, effect of refractive index, calculation of the gain coefficients, relation of the gain coefficient to current density, Semiconductor Injection Laser :Efficiency, Stripe geometry

LED materials, commercial LED materials, LED construction, Response time of LED, LED derive circuitry.

Section-B

Optical Detectors: Introduction, Device types, Optical Detection. Principles, Absorption, quantum efficiency, Responsivity, Long wavelength cut off, Photoconductive Detectors, Characteristics of particular photoconductive materials. Solar cell, Holography and its applications, Liquid crystal displays The Optical Fiber, Multimode and Single Mode Fibers, Glass Fibers, Plastic Optical Fibers, Fiber-Optic Bundle, Fabrication of Optical Fibers, Preform fabrication, Fiber Fabrication, Free Space Optics

Junction Detectors : detectors performance parameters Semiconductors p-i-n diodes, General Principle, quantum efficiency, Materials and design for p-i-n photodiodes. Impulse & frequency response of p-i-n photodiodes. Avalanche photodiodes detectors. The multiplication process . Avalanche photodiodes (APD) design, APD bandwidth, phototransistors

**M.Sc. IV Semester
PHYMS-405
Project**

All the M.Sc. Physics Students will do a supervised Physics Project in IV Semester. Department considers it an important culmination of training in Physics learning and research. This project shall be a supervised collaborative work in Theoretical Physics (Condensed Matter Physics, Nuclear Physics, Particle Physics), Experimental Physics, Computational Physics. The project will aim to introduce student to the basics and methodology of research in physics, which is done via theory, computation and experiments either all together or separately by one of these approaches. It is intended to give research exposure to students at M.Sc. level itself. Following will be the modalities:

- (i) Since lot of ground work including purchase of components/ equipments may be involved depending on the choice of the project, a strict schedule will be drawn and followed, to meet the deadline for submitting the project as laid down below.
- (ii) The students will be allotted M.Sc. IV Semester project in consultation with their supervisors well in advance but not later than middle of third semester i.e. 31st oct to give students ample time to work on the allotted topics in consultation with their supervisors. To develop team spirit and group learning, students will be allotted projects in **groups of three to four students but not more than four students in any case.**
- (iii) Students will be informed about their respective groups (three four students per group) which will be formed by inviting applications from the students who want to together as a group in the office of Physics Department, after due recommendation from the supervisor under whose supervision they wish to work along with a tentative title/topic by 30th of September.
- (iv) Students can choose topics from the following major fields or any other field decided from time to time for which department has the faculty and facilities
 - i) Particle Physics/ Nuclear Physics
 - ii) Condensed Matter Physics/ Material Sciences
 - iii) Computational Physics
 - iv) Electronics
 - v) Experimental Physics
- (v) Students will discuss the topic with the supervisors and submit a one page typed abstract giving the plan of the same by 31st November along with the list of components

project) needed for the project and start working on the project
g resource material, references, setting up the experiments,
al frame work, and writing of the programs for computation if
any. During the period of project students will have to give a seminar as per the
schedule notified by the chairman. The plan of work should include information about.

- a) Gathering resource material
- b) Setting up of the experiment if any
- c) Understanding of the theoretical frame work.
- d) Writing of the program for computation if any
- e) References

- (vi) Group of students working on a particular topic will be required to give a presentation in the beginning of the IV semester i.e. February/ March about the progress made by them during vacations. The presentation should be preferably in the forms of a power point presentation.
- (vii) IInd presentation of the progress of the work will be held in April.
- (viii) A complete seminar on the project will be held in the month of June before submission of the project report.
- (ix) Three copies of the project report will be required to be submitted in the office of the Physics department for final evaluation by the external examiner.
- (x) A format of the project report as per the details given in below:

Instructions for the Formatting and Presentation of Project Report

The following instructions be strictly adhered to while formatting the Project Report.

- Top margin = 2.54 cm
- Bottom margin = 2.54 cm
- Left margin = 3.17 cm
- Header and Footer = 3.17 cm
- Page Size = 1.25 cm (from edge)
- Font = Times new Roman
 - Body test size í í í í . 12pt
 - Chapter headings í í í 18 pt Bold
 - Section heading í í í í 16 ptBold
 - Sub Section heading í í .14 pt Bold
- Header and footers
 - Header í í í í í í Chapter Name
 - Footer í í í í í í .. Page number
- Spacing before and after body text paragraph 6 pt uniform
- Spacing before section headings Zero
- Spacing after section headings 12
- Line spacing 1.5 lines
- Tables í í í í í í í í í í í í Centered, captions must.
- Diagrams í í í í í Centered, captions must, No text around Diagrams

Your complimentary
use period has ended.
Thank you for using
PDF Complete.

Unlimited Pages and Expanded Features](#)

For entailing chapters 1 to 10. Roman Numbers
For entailing pages of chapters 1 to 10. Arabic
The pages starting from Certificate to list of graph and figures must be enlisted
in chronological sequence using Roman Numbers.

Final Project report must be

- Hard Bound
- Rexene Covered
- Golden text to be used on cover
- Print details on side strip also in text book format.

Paper to be used

Bond paper

Total Number of copies to be submitted along with soft copy on a CD 4 Copies

Last Date for Submission of Project Report

Last date for submission of project report shall be one month after the last
theory paper examination of IV Semester for regular students.
